Miracleism:
Exotic Structure and Meaning After Scientific Disenchantment

Ajax Benander*

October 2026 — Working Draft, rev. 8.3

Abstract

Scientific inquiry has undermined some traditional cosmological warrants for human significance, and self-authored purpose cannot, by itself, reproduce the discovered cosmological warrant at issue, because it preserves the feature the loss exposed: the warrant's source remains ourselves. This paper asks whether further inquiry could disclose an independently existing structure that supplies a different warrant, and argues, conditionally, that it can. If the realized natural history occupies an extraordinarily narrow and target-accordant region of possibility space, and if that region is a coupled structure of which the observer is a physical continuation, then there is an independently discovered object to which existential significance can answer, and the significance is participatory: the discoverer is part of what is discovered, at a point where its continuation can still be preserved or forfeited. The paper's own contribution is the argument from that relation to two defeasible verdicts, that awe is fitting toward the object and that its continuation gives its inheritors a reason for care, defended against a reader who grants the descriptive claims and disputes the reasons. The end-Cretaceous bottleneck is examined as a Miracle that is, on the Golden axiology, about as positive as an event of the record can be: a node of exotic structure, and the liberation of the mammalian channel from the Dark Era. The grey case is the earlier Dark Miracle, the origination of the theropods, whose cost our own lineage bore and still carries. The Golden Point is examined as the condition under which inherited significance reaches living fruition without the future creating or erasing its source. The companions' emergence theorem says why exotic structure belongs in that account: conditioning on survival through every proper time selects any fractional lowering of the total hazard, however rare the structure that buys it, so that the structure's minute prior weight is overridden and the Golden Point's necessity is emergent; and on the author's Paradox of Departures the record's own rarity caps the weight of a departure short of that point. Every empirical premise is imported at its stated grade from the companion papers; the bridges are philosophical premises and are marked as such.

*Email: akb9408@rit.edu. This is a philosophical paper that imports its technical results rather than re-proving them: the Accordance Principle, the Rare-Earth inference, the High-Contrast Earth Hypothesis, and Optimal Earth from the Nexic companions [1, 2]; the survivorship model and its ceiling from [3]; future-targeted accordance, with the scoping of an Aethus for inhabitability that it instances, from [4]; the emergence theorem, the Square–Cube Theorem and the Upscaling Theorem from [5]; and the Golden Point and the Route World hypothesis, with the Golden Axiom and the Paradox of Departures, from [6]. Its own contribution is the interpretive argument, and every claim it makes is graded. Drafting collaboration: Anthropic Claude (Opus 4.x, Fable 5), under the author's direction; the first-person sites remain the author's to write.

1 The question disenchantment leaves

Two announcements frame the strand of modern thought this paper begins from. Nietzsche's, in 1882, was that the source from which meaning had been received could no longer be believed in [7]; Weinberg's, in 1977, from inside the physics that had replaced it, was that the more the universe seems comprehensible the more it seems pointless [8]. Between them lies a familiar genealogy: explanation displaced the special creation, the central Earth, and the designed body, and each displacement was correct because the explanation was better than the object it replaced. Nietzsche reported from inside what it is like when a whole structure that had grounded values fails at once; Weinberg's sentence extrapolates the slope he could see. Neither is corrected here. On the evidence available to them, the downward inference was reasonable.

The genealogy is a schematic account of one strand, offered as motivation, and it is narrower than three things it is easily mistaken for. It is not a history of secularization: Weber's disenchantment concerned the retreat of magic and of ultimate meaning from a rationalized world, the loss of a cosmological warrant being one thread among several [9]; Taylor's secular age is a history of the conditions of belief, in which belief and unbelief became options within a shared immanent frame, not a story of subtraction [10]; and Josephson-Storm argues that the disenchantment narrative is itself partly a myth, enchantment having persisted alongside and inside modern science [11]. Nor does the scientific displacement of particular theological explanations establish nihilism, a philosophical conclusion with its own arguments; Weinberg's sentence reports a mood as much as an inference. And science has not previously produced only disenchantment. Darwin closed the *Origin* by finding grandeur in the view of life his explanation afforded [12], and the scientific sublime has a literature of its own [13]. That predecessor is a resource for this paper rather than an inconvenience: naturalistic wonder is older than Miracleism, and nothing below claims otherwise.

What the strand does establish is narrower and sufficient. The objects previously offered as meaning's external warrant were removed by explanation; the removal was a gain in understanding; and a warrant of the removed kind cannot be restored by lowering the standards that removed it. Returning to the certainty of the premodern peak would be a return by discarding the knowledge responsible for the descent, which is why the paper sides with the settlement against every restoration; the dragon that supplied meaning by coupling fear with control stays dead. The live question is whether the same engine, run further, finds anything else.

The question needs to be asked precisely, because several questions travel together under the word *meaning* and their answers do not arrive together. One is descriptive: what kind of natural history produced us. One concerns fitting emotion: whether that history is an appropriate object of awe. One concerns existential significance: whether our participation in it makes our lives significant. One is practical: whether we have reasons to preserve its continuation. One is social: whether a shared understanding of it could change how a species deliberates. An object can warrant awe without warranting preservation; a person can participate in something significant without special responsibility for its future; a true account can be motivationally inert. This paper's thesis concerns the third and fourth questions, and it concerns a particular form of significance, which may be called *participatory*: the significance available to an agent who discovers an independently existing natural history, recognizes itself as a continuation of that history, and understands its present agency as bearing on the history's unfinished future. Three things that can come apart are placed now. Significance attaches through participation itself: being a continuation state of the history is a fact about the agent that holds whether or not it is recognized, and it is the ground of everything that follows. Recognition of that

participation is what makes awe fitting *for* the agent and gives the agent access to the reasons the relation supplies. Engagement with the continuation is where the reason for care has its object and where responsibility attaches. Participatory significance is therefore not a third verdict beside awe and care; it is what both are about, the fact of participation supplying the object, its recognition the fittingness, and its continuation the practical reason.

At each transition below the premise doing the work is named, and Section 9 collects the premises with their grades.

One commitment is announced now. The companions supply two descriptive claims of different strength. The weaker is that the record is rare and target-enriched: the realized history is improbable under the baseline and enormously overweighted under conditioning on the biosphere's survival. The stronger, the Route World hypothesis, is that the law governing the realized historical ensemble is the conditioned law itself, so that target-consistent structure is generated rather than retrospectively selected. In the Route World companion's own primitives the stronger claim is the Golden Axiom, that it is a parent Aethus to one's Aethus that the universe is conditioned on one's biosphere surviving at least through every proper time, an exposed postulate [6]; Section 7 states it with what bears on it. Much of the interpretation below is available under the weaker claim alone; what the stronger adds is stated where it enters (Sections 6 and 7), so that the contribution of the stronger ontology is visible without the argument depending on it everywhere.

2 The object: rarity

The evidence begins in probability, and probability is the doorway and not the final ontology. The Nexic companion's Accordance Principle is the constraint Bayes' theorem returns from a Copernican draw together with the existence of a conditioning target: a realized attribute's prior improbability is compensated by its relevance to the target, with κ-fold violations confined to probability $1/(1+\kappa)$ [1, 4]. Run on the record, the principle yields the Rare-Earth inference under stated antecedents and, with the High-Contrast Earth Hypothesis, the Optimal-Earth program: the realized natural history is not one ordinary member of a large equivalence class of living worlds but sits in an extraordinarily narrow region of the space of possible histories, and in a region the target picks out [2].

Definition 2.1 (The two magnitudes)**.** Let A^* be an independently specified configuration of the record, C the common baseline of observers existing now and the biosphere having survived to the present, and $G_T = \{T_{\mathrm{dep}} > T\}$ the horizon event that the biosphere survives to horizon T, the target being read through the horizon family because in the critical regime the event of indefinite survival is null and cannot be conditioned on directly [3, 4]. The *surprisal* of A^* is

$$I(A^*) = -\log \mathbb{P}(A^* \mid C),$$

and its *selection amplification* at horizon T is

$$\mathcal{M}_T(A^*;\mathcal{G}) = \log \frac{\mathbb{P}(A^* \mid G_T, C)}{\mathbb{P}(A^* \mid C)} = \log \frac{\mathbb{P}(G_T \mid A^*, C)}{\mathbb{P}(G_T \mid C)},$$

the second equality by Bayes at every finite T; where the companions have established the limiting conditioned law, the amplification under the target is $\mathcal{M}(A^*;\mathcal{G}) = \lim_{T\to\infty} \mathcal{M}_T(A^*;\mathcal{G})$, and every expression below written with $\mathcal{G}$ is shorthand for that limit where it exists and for

the finite-horizon form otherwise. A configuration is a candidate Miracle when both magnitudes are large: rare under the baseline, and enormously enriched by the target the history appears to serve.

The distinction defeats the cheapest objection, that every sufficiently detailed history is improbable. The shuffled deck has I of about 226 bits and $\mathcal{M}$ of zero for any target independent of the deck's ordering, since nothing about such a target enriches one ordering over another, and a target invented to prefer a particular permutation fails the independent-specification guard below. A Miracle in the sense this paper needs is a rare event that the target amplifies, and the amplification is a statement about the record and the target, not about the fineness of a description.

Four guards keep the magnitudes from being manufactured, and they are requirements on any configuration the paper calls a Miracle. The attribute must be *specified independently* of its rarity, before or without reference to the record's detail, so that no retrospective microdescription inflates I; a configuration built from every molecule and every coin toss has probability near zero and signifies nothing. It must be *counterfactually relevant* to the target, a requirement separate from enrichment: $\mathcal{M}_T$ measures association under the specified law, the overweighting of A^* in the conditioned ensemble, and does not say what would have happened to the target had A^* been otherwise. The counterfactual test is the Route World companion's route-deletion audit, read under the framework's native settling operation, in which an attribute is settled to its alternative and the target's probability is recomputed on the settled state [6, 14]. The two coincide only where settling A^* leaves every other entry's standing unchanged; in general settling detaches an attribute from its grounds while conditioning does not, and no reduction of the one to the other is assumed. Where only enrichment is available, the configuration is a candidate and not yet a Miracle. Its rarity must be *robust across a defensible model class*, so that the reported magnitude is a conservative lower bound,

$$I_{\min}(A^*) = \inf_{\theta\in\Theta}\big[-\log \mathbb{P}_\theta(A^* \mid C)\big], \qquad \mathcal{M}_{\min}(A^*;\mathcal{G}) = \inf_{\theta\in\Theta} \log \frac{\mathbb{P}_\theta(A^* \mid \mathcal{G}, C)}{\mathbb{P}_\theta(A^* \mid C)},$$

taken over models deliberately chosen to make the event ordinary. And wherever possible the configuration should carry *prospective* confirmation, a prediction scored on record not yet read, which the Route World companion's protocol supplies. The paper claims no particular figure such as 10^{-1000}, and it does not re-derive the companions' bounds. Its claim is conditional on them, and the results consumed are these, each at the companions' deposited version of September 2026. The exceedance pricing is the theorem companion's Theorem *Future-targeted accordance* with its multiplicity guard, in the section of that name [4]; its assumptions being a draw under the target-conditioned measure and, for survival targets, the survivorship model's horizon family. The route-deletion requirement is the Route World companion's Proposition *Significance from route-deletion* and the remark on the counterfactuals it excludes, in the subsection on flukes [6], stated there within the model and graded structural rather than proved. The Rare-Earth inference is the Nexic companion's Accordance Principle with its Substitution Property and Common-Ground Schema, which bound the abundance of any articulable observer-class by inclusion; the quantitative figure is that companion's Dinosaurian-extrapolation corollary in the subsection *Followup Nexic Extrapolations*, an upper bound of order 10^{-27} per planet, hence at most of order one observer-bearing world per observable volume,[1] under the stated assumption that rare target-relevant attributes are not anomalously concentrated in the interval analyzed,

[1]The conversion, for a reader checking it. The companion's sampling unit is a planet drawn under the cosmic

which the companion itself grades below the Accordance Principle [1]. The robustness requirement displayed above, the infimum over a model class chosen to make the event ordinary, is this paper's requirement on any candidate; no companion result is claimed to have discharged it, and where the companions' assumptions are contested the claim is contested with them.

One further result is stated because it licenses a phrase that is easily over-read; it concerns records with a certain structure and asserts of no record that it has it.

Proposition 2.2 (Unbounded amplification along a joint limit; conditional)**.** *If the record admits an independently specified nested family of events $A_1 \supset A_2 \supset A_3 \supset \cdots$, drawn from canonically refining partitions, for which $\mathbb{P}(A_n \mid C) \to 0$ while, along a joint limit $T_n \to \infty$ with $\mathbb{P}(G_{T_n} \mid C) \to 0$, $\mathbb{P}(A_n \mid G_{T_n}, C)$ stays bounded away from zero, then $\mathcal{M}_{T_n}(A_n; \mathcal{G}) \to \infty$ as $n \to \infty$; at any fixed finite horizon T with $\mathbb{P}(G_T \mid C) > 0$ the amplification is bounded by $-\log \mathbb{P}(G_T \mid C)$, a ceiling independent of descriptive refinement, so the absence of a ceiling is a statement about the joint limit and the order in which it is taken, never about a fixed horizon: the evidential contrast the method extracts has no ceiling set by the method, only by the record.*

The proposition's content is unbounded evidential contrast under canonical refinement, and nothing more: no finite record carries infinite evidence. Whether the record of natural history admits such a family is an empirical question the Nexic program addresses and this paper does not settle; the proposition licenses no numerical lower bound for the actual history, and the canonical-refinement requirement keeps the family from being manufactured by redescription.

Rarity does two jobs. The first is epistemic: it is what makes an observer stop and say that something requiring explanation is happening; without it, coupling looks like ordinary causal organization. The second is cosmic, and it is stated in two steps. The Rare-Earth inference, under the Nexic companion's abundance bridge named above, yields a low density of comparable observer-bearing biospheres. Low density is not yet a small number: the step from density to count requires a domain, the observable volume under the cosmic weighting, and the quantitative bound named above, imported without re-derivation [1]. "One of extraordinarily few" is therefore a conditional claim, relative to that domain and to that bound. If the bound holds, the reader's indexical situation changes, from one observer-bearing world among multitudes to one of few within the volume that could ever be surveyed. The stronger image, that the expanse is sterile of life altogether, needs an additional bridge from observer rarity to biotic rarity, since simple or even complex non-observer life could be common while observer-bearing histories remain rare; that bridge is a separate empirical conjecture. The conservative version is what the paper relies on; the ambitious version is marked where it is used.

What the magnitudes deliver, before any interpretation, is a scale conveyed by the only analogy that fits: Graham's number, rigorously defined by a compact recursive notation, can be established to lie beyond ordinary numerical representation while no proportionate intuitive representation of it can be formed [15]. The proposition that this route occupied an extraordinarily tiny fraction of baseline possibility space can be fully understood as a fact and remain unrenderable.

---

weighting, and the quantity bounded is the probability that such a planet carries an observer-bearing biosphere over its history, obtained by extrapolating the Mesozoic rate at which required anthropic parameters are met, $\lambda \gtrsim 0.0136$ per million years, over 4.54 billion years: $e^{-\lambda t} \lesssim 1.6 \times 10^{-27}$. The expected count within the observable volume is that probability times the volume's planet population, which the companion does not fix numerically, so that its "no more than one per observable universe" is the per-planet bound times a population of at most 10^{27} planets; the Common-Ground Schema then bounds every articulable observer-class by inclusion. The companion files the extrapolation as a conjecture, and this paper consumes it at that grade.

3 The object: coupling and exotic structure

A number, however small, is inert. 10^{-1000} by itself does not feel like anything, and if Miracleism were the sublimity of improbability it would be answered by the shuffled deck and by the observation that awe at a small number is a category error. The thing encountered is upstream of the number.

The Nexic companion's hierarchy says where: a flat probability is a lossy projection of a hazard and improbability structure, itself a lossy projection of an Aethus-valued structure, the record as a set of stated attributes with their dependencies [1, 14], so that reducing a Miracle to $\mathbb{P}(A) \ll 1$ discards the feature the paper finds significant. The Accordance constraint does not terminate where it is applied: one extraordinary requirement implies another, which constrains a third, which explains why a fourth apparently bizarre feature had to occupy its particular place, and the closure of that propagation is a single object rather than an inventory of independent surprises,

$$\mathcal{E} = \text{Closure}(A_{\text{root}};\ \text{Accordance, coupling}), \qquad \mathcal{E} \neq \{A_1, A_2, \ldots, A_n\}.$$

The object is given witnesses so that coupling and depth are inputs and not adjectives; the formal apparatus and its audits are in Appendix A. In outline: the witnesses are native to the framework's settling semantics, the relation that matters being what happens to an attribute's target effect when other attributes are jointly settled to their alternatives, and generic statistical dependence is not the measure. The dependency object is a weighted interaction hypergraph whose hyperedges record higher-order target interactions that no pairwise test can see; the exotic structure generated by a root is that hypergraph together with its forcing relations on the closure the root generates, a structured closure and not the bare inventory of its members, which is what the inequality above marks. Its witnesses are a coupling mass, a depth, and the rarity of the realized conjunction. *Non-reductive* means nonseparability of the specified kind and nothing more; depth is the iteration depth of a stated presentation and not an intrinsic height, and the argument uses of it only that the closure is not reached at the root; and the witnesses are defined on description classes modulo refinements carrying no target information, with the invariance that is constructed and the invariance that is required kept apart. The definition is an interpretive formalization of conjectural upstream structure, graded **[I]** on the companions' **[C]**.

A mechanism with no forcing relations and no target interaction at any admissible order would be reductive: its interaction hypergraph empty, its depth zero, its identity the list of its members. Exotic structure is not that. Its identity resides partly in the relations, so that perturbing a major member reconfigures the rest and destroying the coupling destroys some of what the thing is rather than only the bookkeeping about it; the Nexic companion calls the optimal Aethus a knot, its parts standing where they do because the others do. Rarity supplies the contrast with the baseline and coupling the integration that makes the closure one object rather than a list, and nothing in either is yet a claim about value, which is the business of Sections 4 and 5. Rarity is exotic structure's scalar shadow, not its definition: the shuffled deck is low probability with low coupling, no depth, and no inherited relation to the observer, and no scalar cutoff on probability makes anything exotic. Why a structure this rare is nonetheless what survival through every proper time selects is the emergence theorem of Section 7.

4 Provenance and value

One influential secular response to the loss, the constructionist settlement, is that whatever meaning there is, we make. It is not the only position philosophy has taken: naturalistic objectivist accounts hold that mind-independent features of the world can confer meaning, and hybrid accounts such as Wolf's hold that objective attractiveness must meet subjective attraction [16, 17]. Miracleism claims no priority for the bare possibility of naturalistic objective meaning. Its proposed contribution is the object alleged to supply it and the observer's relation to that object. The settlement is granted its premise entirely; what is not granted is that construction can reverse the descent, and the reason is a matter of provenance.

Consider a person who begins with no externally licensed meaning and some structure of concerns, and who perturbs it at will: a career, a cause, a community, a moral theory, humanity, art, the progress of science. The projects can be made as noble as one likes, and every such transformation preserves one property, the one the descent removed. Ask of the candidate warrant behind a meaning structure, rather than of the significance itself, where it came from: whether it was authored by the agent or the human community, or encountered in the world and not put there. Self-authored transformation of self-authored warrant yields self-authored warrant, and the statement is close to definitional, since the transformations were defined as self-authored; that is its strength and its limit, and it is not a proof that constructed meaning is not meaning. It is the narrower observation that self-authorship cannot reproduce the particular external provenance that disenchantment removed, which was not a purpose of any particular size but a purpose of the other provenance class: something the person did not put into the world and encountered as larger than the scale on which they ordinarily manufacture goals. What could change the provenance class is not another project. It is evidence that changes what the world itself warrants.

Provenance cannot carry the evaluative burden by itself, however, and three questions that the word *independent* runs together must be separated. Whether the object exists independently of our wish for significance. Whether our evidence about it is independent of that wish. Whether its existence supplies reasons to value it. The first two establish that Miracleism is responsive to reality rather than constitutive of its object, and the companions' protocols are addressed to them. The third is the philosophical claim, and two ordinary cases show that it does not follow from the first two. A human-created work of art can possess merits its maker cannot determine by wishing; authorship does not make value arbitrary. A naturally occurring destructive process, a pandemic strain or an advancing ice sheet, is entirely independent of human authorship and deserves no continuation; external provenance does not make a thing valuable. The provenance distinction identifies a difference in source. Which sources confer value is a separate question, and Section 5 answers it for one object by argument rather than by provenance.

The same discrimination applies to the taxonomy of how existential authority reaches a person. *Authored*: I supply the significance. *Received*: another alleged authority tells me the significance. *Discovered*: the world supplies evidence from which I find it. The premodern religious source is predominantly received, the constructionist reconstruction predominantly authored, and the third cell's defining property is that the source of warrant is an independently encountered natural fact, so that valuation is responsive to the object. But the cells are not watertight: chosen projects and relationships encounter standards and reasons their participants did not invent. What the discovered cell adds is the independence of the object itself: a natural history that would have the structure it has whether or not anyone found it worth engaging.

Wolf is the right interlocutor here, because her account already joins subjective engagement

to objective worth and so offers a far stronger alternative than arbitrary self-authorship: meaning arises, on her view, from active engagement in projects of worth, the worth not conferred by the engagement [16]. What Miracleism's object adds to that relationship has three parts, of which the paper defends the first two and holds the third at the stronger grade. It proposes a special relation to an existing kind of value: the goods of living history, experience, understanding, relationship, and the biosphere's living forms, are recognizable objects of worth on many accounts of objective worth, and the discovery relates the reader to them as their inheritor and continuation rather than as their admirer. It proposes a new reason for engagement: the continuation of those goods is, on the companions' claims, irreplaceable and still open, which changes what engagement with them is for. And it proposes, at the stronger grade, a new bearer of worth, the integrated history itself, whose value is not exhausted by the goods it carries; Section 5 says what that claim requires. On Wolf's scheme the object supplies the worth and the discovery supplies a route to the attraction, one that is responsive rather than constitutive.

Transmission is not authorship. A reader can receive testimony about a discovered warrant, as nearly everyone receives most of what they know of natural history, and communities can author educational materials and practices responsive to it, without the underlying object becoming a product of the demand it answers; the theory of evolution reached most people through testimony and is not thereby authored by them. The paper's claim concerns the source. Acquisition and expression are the subject of Section 8.

5 Awe and care

What the discovery, should it be secured, does to a person is answered by decomposition rather than by definition, because the phenomenon is partly ostensive. The decomposition is an inventory and not a response function: no map from its components to any feeling is claimed.

The Nexic sublime

The encounter with exotic structure has five components, four from the Nexic companion and one from the Golden companion.

Component	Witness	What it contributes to the judgment
Rarity R	$I_{\min}$; $R(\mathcal{E})$	scarcity, and under the Rare-Earth bridge the scarcity of comparable observer-bearing worlds
Coupling K	$K(\mathcal{E})$	integration: the object is a knot and not a list
Depth D	$D(\mathcal{E})$	recursive articulation: resolving one node can expose further coupled prerequisites beneath it
Incorporation X	descent	the observer is a continuation state of the structure observed
Futurity F	G_T	the continuation is unfinished and can still be reached or forfeited

Scale and depth are the stuff of the mathematical sublime, and integration is what distinguishes an organism from a heap; incorporation and futurity are what distinguish the Nexic sublime, and they are best seen against Kant. On Kant's account the sublime is occasioned by the object's defeat of the imagination and consists in the mind's discovery of a capacity, reason's idea of totality or the moral vocation, that the sensible magnitude cannot touch, so that the

subject is elevated above nature in the very experience of being overwhelmed by it [18]. The Nexic sublime shares the first movement, the magnitude that cannot be rendered, and reverses the second. What the encounter discloses is not a capacity that transcends the object but a constitution that belongs to it: the present biosphere is one of the structure's continuation states, and so is the reader,

$$A_{\text{abiogenesis}} \preceq A_{\text{Cambrian}} \preceq A_{\text{end-Cretaceous}} \preceq \cdots \preceq A_{\text{now}}.$$

The thing whose extraordinary structure is being discovered includes the discoverer. The disclosure reconciles rather than elevates; it is the discovery of dependence, and the observer's own vulnerability enters the fitting response, because the vulnerability is the structure's, shared by every continuation state that has so far survived. And because the object is unfinished, contemplation is not sealed off from action: to apprehend the structure adequately is to apprehend oneself at a point from which its continuation can be affected, which no mountain or storm asks of its spectator. This is the content of the phrase that stands at the literary center of the paper, *too vast to be conveyed and too personal to be named*: vast warranted by rarity, coupling, and cosmic scarcity; personal warranted by descent, the reader physically downstream of exactly the route the exhibit of Section 6 describes; and the failure of language to convey their conjunction part of the phenomenon rather than a defect of the argument.

Fitting awe

Miracleism makes a stronger claim than that awe is available: conditional on the empirical ladder holding, and on the object being apprehended at the grain the preceding sections specify, awe is the fitting response to it.

Premise 1 (Fitting-awe bridge; [Φ])**.** Awe is defeasibly fitting toward an object when adequate apprehension reveals a conjunction of cognitive vastness or depth, non-reductive structured unity, and an indexically consequential relation between the observer and stakes extending beyond the observer's ordinary local horizon.

Fittingness is a claim about the accuracy of an emotion's presentation of its object, and it should be distinguished from two things with which the word *appropriate* is often conflated: from the moral or prudential appropriateness of having the emotion, and from the probability that a person will feel it [19]. Awe presents its object as vast or deep beyond the subject's ready grasp, as unified rather than scattered, and as bearing on the subject in a way that calls for accommodation rather than mere notice. If the ladder holds, the object has those properties: rarity and depth supply the vastness, coupling the unity, incorporation and futurity the bearing. So awe is fitting in the sense that its evaluative presentation of the object is accurate. Nothing in that claim compels a nervous system, and affect supplies no evidence for the framework; a reader who finds in themselves curiosity, grief, or ambivalence is not thereby mistaken, since fittingness is non-exclusive. What the bridge denies is narrower: a response that registers only the scalar probability has not yet taken in the object described, since the object is not the probability. Felt awe is no test of comprehension; comprehension is a test of what one's awe, if any, is about.

Four attitudes should then be kept apart, because the argument's most tempting error is to let one carry the others. Awe is fitting to scale, unity, and bearing, and a threatening object can be awe-inspiring. Admiration is fitting to achievement or excellence, and sits uneasily

here, since no agent achieved the structure; what can be admired without an agent is the form of a solution, the way the end-Cretaceous configuration threads a joint constraint, and that admiration is compatible with withholding approval from what other passages of the route cost. Affirmation is a verdict that the whole is good, or that one is glad it occurred, and it is not entailed by awe or admiration; Section 6 argues that across a Dark Miracle it must be issued, if at all, without retrospective approval of every cause. Care is a practical attitude with reasons of its own, and it is the subject of the second bridge. Awe supplies none of the practical content; a person can be awed by the structure and conclude nothing about what to do. The transition from awe to care is therefore not a transition at all. It is a second premise.

The care bridge, and the opponent who grants the science

Premise 2 (Care bridge; [Φ])**.** If an agent adequately apprehends itself as a continuation of a non-authored, extraordinarily scarce, internally structured history carrying goods worth sustaining, whose live continuation can still be preserved or forfeited, that relation supplies a defeasible reason to care about the continuation. It does not by itself supply a categorical duty, rank competing reasons, or imply that every continuation is good overall.

The premise is the value-theoretic step the probability theory cannot perform, and it needs a defense against a reader stronger than the shuffled-deck objector. Grant this reader everything descriptive: the history is exceptionally rare, its structure internally coupled, we are continuations of it, its future remains consequential, and even the stronger claim, that the governing law is conditioned on the continuation, is true. The reader asks why any of this makes the history valuable rather than merely remarkable, and why being its continuation gives them a reason to preserve it. They are not protecting nihilism from evidence; they dispute the account of reasons, and Nagel supplies their sharpest form: being part of something larger, longer, or more encompassing does not by itself answer the demand for justification, since the larger thing's mattering can be questioned exactly as one's own was [20]. Magnitude, duration, and enclosure within a vast project are not reasons. The care bridge must say what the particular relation between the observer and the history contributes beyond them.

The answer assigns different features different work, and the thesis is the conjunction. Begin with what is valuable. Nothing in the account asks anyone to value improbability. The history whose continuation is at issue is the realized history of goods that many accounts of objective worth already recognize and that the reader addressed here grants: living experience, understanding, relationship, creativity, and the living forms of the biosphere in which those goods have so far been carried. Those goods generate reasons for care wherever they occur, and the first thing the discovery does is show that they are carried, here, by one integrated and vulnerable continuation rather than by a scattering of replaceable instances. Scarcity then does not create value; it changes the reason's object. In a world where living worlds were abundant, the reason to care for the goods would attach to the goods wherever found, and the loss of one carrier would be compensable by others; where the carriers are, within the surveyable volume, extraordinarily few, the reason attaches to this continuation, which has no substitute. That is the difference between a good and an irreplaceable good, and it is a difference in reasons, not in feeling. Incorporation adds a relational reason of a kind ethics already recognizes. Reasons arising from relationships one did not choose, to a family, a language, a received body of knowledge, are not consented to and are not thereby void; one can be bound to what one is made of. The observer is not a spectator who has learned that a rare thing exists somewhere. The observer is

a continuation state of it, constituted by its passage through the bottlenecks, and the reason to care for its continuation is of the same kind as the reason a person has to care for what has made them what they are, with the difference that here the relation is literal and physical. Nagel's challenge is answered at this point and not before: what the relation contributes is not size but constitution. Futurity adds the prospective element. The continuation can still be preserved or forfeited, and agents now have leverage over which; responsibility attaches where relationship and situated agency meet, and its extent, which Section 8 returns to, depends on what an agent can reasonably do.

Two routes to the bridge have been distinguished. One holds that the unusual structure itself has evaluative importance; the other begins with recognizable goods and argues that the discovery reveals their integrated, vulnerable, and irreplaceable continuation, rarity intensifying an existing reason rather than creating value from nothing. The argument above runs the second route, which suffices for every conditional conclusion the paper draws about awe, care, and responsibility. The stronger thesis should be stated precisely, since two claims travel under that description. The weaker of the two is that the history's organization makes the goods it carries a particular, nonfungible object of concern; that claim follows from the identity condition of Section 3 and is already part of the goods route. The stronger, which is the thesis, is that the integrated history has value beyond the independently valuable goods it carries. Identity alone does not establish it: a harmful institution can possess a distinctive, integrated, irreplaceable identity, and its loss would remove a particular thing, without that thing meriting valuation. The organization of this history is an organization *of goods*: the goods it carries are its products and its mode of continuation, their identities include their places in it, and the relations that integrate them are the relations by which they came to be and are sustained. An integration of goods of that kind is a bearer of value in its own right, in the way a life is valued as a whole beyond the sum of its good moments, or a work beyond the sum of its passages, where destroying the unity while preserving the parts' value sum is itself a loss. The premise is an organic-unity premise restricted to unities of goods, and it is stated for mixed histories, since no actual history is a unity of goods alone. A harmful institution can produce and sustain some genuine goods, and the natural history at issue contains suffering and destruction beside what it carried forward, so the premise does not sort organizations into the wholly beneficial and the wholly harmful. It says that the relations by which goods are produced and sustained contribute positive value, and that the contribution neither makes the whole good overall nor justifies its costs. A mixed history can bear organizational value and remain mixed, the verdict Section 6 issues on the Dark Miracle; an institution whose organization sustains much harm has organizational value, if any, that those harms can outweigh, the hostile-inheritance case below. The premise adds a value to be weighed, not a verdict that preempts weighing, which is what the care bridge's defeasibility already provides for.

Moore's principle of organic unities holds that the value of a whole need not equal the sum of the values of its parts [21], and Moore separated that claim from causal interdependence among the parts: a whole can be non-additive in value whether or not its parts depend on one another, and parts can depend on one another without the whole bearing value beyond their sum. That separation is exactly the gap the stronger thesis must cross. Section 3 and Appendix A establish, conditionally, the target-level interdependence of the history's members; the organic-unity premise is the further evaluative commitment that this interdependence, being an organization of goods by the relations that produced and sustain them, is one of the wholes whose value exceeds the sum. Moore's principle licenses the possibility of such wholes and does

not establish that any coupled history is one; the premise asserts it for this object.

What the stronger claim adds to the goods route is then determinate, and the word *uncompensated* is given its scope. On the goods route, comparable goods elsewhere compensate the loss of this carrier, and what scarcity adds is urgency. On the stronger claim, relocating comparable goods does not preserve this organization of them, so the loss of the whole is not made good by any relocation of its goods; that is the claim made. The broader claim, that the loss could not be compensated in any evaluative respect, is not made: a successor whole might bear organizational value of its own, and whether it would outweigh the loss is a comparison of wholes the premise does not settle. Fruition accordingly concerns the continuation of this organization rather than the survival of goods of its kind.

An abundant world permits the replacement of comparable goods; no world permits the replacement of the particular history; compensation for its loss the goods route allows in part and the stronger claim denies for the organization itself; and the additional importance scarcity gives to preserving it, abundance reduces. Abundance could reduce the scarcity-based reasons without making this history replaceable or its loss made good by relocating its goods. The two routes are therefore layered rather than rivals: the goods route says what is valuable; the structural route says why this organization of those goods, as this organization, is the object and why its loss is a loss of its own. A reader who rejects the organic-unity premise keeps the paper's conditional conclusions; a reader who accepts it has the stronger thesis.

Three cases

Three cases isolate what each feature contributes, and none needs the full Golden hypothesis. *An abundant world.* Suppose life and worthwhile experience are common across the surveyable volume. The goods route and the care bridge's reason survive, and comparable goods elsewhere could replace the goods this carrier holds, so the scarcity-based reasons weaken and the reason detaches from location in that respect; the particular history remains irreplaceable, and on the stronger claim its destruction remains a loss no relocation of goods makes good, so what abundance removes is urgency and location-binding, not the object. Miracleism in that world would supply participatory significance of a different kind, incorporation without scarcity, with less urgency rather than less meaning. *A hostile inheritance.* Suppose a rare, intricately coupled history perpetuates severe suffering, so that its continuation would be the continuation of harm. The features that support care, the goods and the relational reason, are then partly absent or outweighed, and the scarcity of the structure does not rescue it: the bridge's reason concerns a continuation carrying goods worth sustaining, and where the continuation bears mostly harm the reason is defeated or outweighed. Bare persistence is not the bridge's object, and continued existence is not sufficient for the reason; the continuation must carry what made the history worth continuing. *A final generation.* Suppose a rich history will inevitably end and nothing can preserve it. The prospective reason lapses with the agency, and with it the responsibility that depended on leverage; the realized significance does not lapse, since nothing in the past is undone by the end, and what remains fitting is acknowledgment, grief, and the completion of what can still be completed. The Golden fruition is then impossible, and the inheritance is in vain in the restricted sense Section 7 defines, without having been without significance.

Defeaters

Because the bridge is defeasible, a countervailing case does not refute it; what defeats or limits its reason is this. The antecedent can fail: an agent who has not adequately apprehended the object, who has taken in the probability and not the structure, does not recognize the reason and cannot act on it in deliberation; the reason itself, being a fact about the relation, does not depend on being recognized, so what the antecedent governs is access to the reason and not its existence. The reason can be outweighed: present suffering, justice among the living, and obligations to particular persons are reasons of their own and are not ranked below continuation by anything in the framework; the bridge supplies a reason and not a ranking, and Section 8 gives a case in which the ranking is the whole difficulty. The reason can be defeated by quality: a continuation that would perpetuate severe harm without prospect of remedy loses the goods that gave the reason its content. The reason can lapse with agency: where nothing can be done, nothing is required, and acknowledgment takes responsibility's place. And the reason never licenses a means by itself: that the continuation matters settles neither which actions preserve it nor who should bear their costs, which is why the bridge is a premise about reasons and not a decision procedure.

6 The end-Cretaceous day: a liberation, and the Dark Miracle before it

The exhibit is the route's clearest Miracle, and it is read against the earlier passage it brought to an end. There is one

day in the record that is, on the Nexic companion's accounting, among the largest concentrated nodes of compounded improbability in the route to us [1], and it is the day the exhibit is built on.

The ordinary description first, and nothing in it is rejected. An impactor struck a shallow, sulfur-rich sea, and the target's chemistry contributed to the atmospheric forcing associated with the mass extinction. The dominant dinosaurian regime ended: about a hundred and thirty-five million years of ecological dominance measured from the end-Triassic, out of a reign of roughly a hundred and sixty million years measured from the group's origin. Small, fragile, endothermic mammalian lineages, among them the ones that would carry the primate line, survived in enough number and in enough places to radiate into the vacated world. Every clause is natural history with an ordinary causal explanation.

Now the same day as a constraint problem. Terminate a globally entrenched ecological regime that had excluded large-bodied mammals from every dominant niche for the length of the Mesozoic, without terminating the small mammalian channel that runs through it; do it in one event; do it with a body whose angle, speed, and target chemistry are jointly such that the aerosol loading is severe enough for the first and not so severe as to foreclose the second. Human intelligence, given the stakes and the tools of the present, could scarcely engineer the realized solution on purpose. That is what the phrase *computational divinity in the rocks* means: a performance metaphor, not an agent claim, and not a complexity-theoretic one, since no input size, search space, or objective has been defined. Natural history instantiated a solution whose deliberate design would be staggeringly difficult, and the solution is in the rocks, where it can be excavated, measured, and measured again. Nothing was revealed. It was dug up.

The evidence for the pieces is local, and the ledger keeps it so.

Claim	Source	Scope
Roughly thirteen percent of Earth's surface held hydrocarbon-rich sedimentary targets which, on the study's modeled soot mechanism, would have produced extinction-scale climatic forcing from a Chicxulub-scale impact	[22]	the impact-location component on one modeled mechanism only; trajectory, velocity, angle, ecological selectivity, and the later evolutionary route are separate constraints
Impact-released sulfur of 67 ± 39 gigatonnes, several-fold below a prominent estimate, favoring a milder sulfur-driven winter	[23]	revises one component of the impact-winter mechanism; the exhibit survives changes in the aerosol decomposition if the coupled structure survives
Lower extinction rates among burrowing mammalian lineages under harsh, fluctuating climates	[24]	one survival trait, independently supported
Impact in boreal spring; underground sheltering and dormancy discussed as possible survival mechanisms in the immediate aftermath	[25]	timing established; the refugia proposed, not established
The joint probability of the whole route is no larger than any single factor's and, under the companion's assumptions on how the factors couple, far smaller; the trait list read as an integrated preparation	[1]	the Nexic companion's structured reading; the strict reduction is its claim, since strongly coupled conditions can share a probability

No entry establishes the probability or optimality of the entire route; the joint claim is the companion's, conditional on its coupling assumptions, and it is the one the exhibit interprets. The exhibit is a conditional illustration of the proposed structure, not an established Miracle: it has not been shown to pass every guard of Section 2, the route-deletion audit and the model-class robustness among them, and nothing below claims that it has. On the Dark Era reading of the Nexic companion [1], the Mesozoic mammalian condition, small, subordinate, nocturnal, denning and burrowing prey at the margins through a hundred million years of disadvantage, is read as an integrated preparation whose signs reverse under the day's realized lethality profile, a continental-scale thermal pulse followed by impact winter: small body size reduces energetic requirements and increases refuge flexibility, marginal and low-trophic occupancy reduces dependence on the collapsing dominant food web, nocturnality may carry traits useful under prolonged low light, and burrowing shields from the pulse. The traits that marked the mammals' inferiority under the ordinary regime are the survivors' kit under the realized event, and the incumbents' formidability is what could not fit down the burrow. Exaptation is the right comparator for traits acquiring new uses, and it does not by itself settle the stronger interpretation; what the Nexic reading adds is the claim that the trait list reverses sign together, as a conjunction, under exactly the profile the conditioned law overweights.

The third description is the companions'. Let $\mathbb{P}$ be the unconditioned law over histories, $Q_T = \mathbb{P}(\cdot \mid G_T)$ the law conditioned on survival to horizon T, and $Q = \lim_T Q_T$ the limiting conditioned law where the survivorship companion has established it. For any event E of the record and any finite horizon T,

$$\frac{\mathbb{P}(E \mid G_T, C)}{\mathbb{P}(E \mid C)} = \frac{\mathbb{P}(G_T \mid E, C)}{\mathbb{P}(G_T \mid C)},$$

so that if the end-Cretaceous configuration is enormously important to getting from the Mesozoic to the Golden continuation, the whole joint configuration of the day is enormously overweighted under the target-conditioned law. That much is selection, available under the weaker descriptive

claim. The Route World hypothesis adds the stronger reading: if the law governing the realized ensemble is the conditioned law, the day is not an event that later turned out to be useful but a local realization of the conditioned law itself, what conditioning looks like when instantiated in natural history. Conditioning can instantiate coordination without a coordinator, and the exhibit is what that looks like from inside the record; no mind aimed anything, and no backward efficient cause acted.

What verdict the day receives depends on the register in which it is read. In this paper's register, *good* and *bad* said of an event of natural history abbreviate target-positive and target-negative under the Golden axiology, and carry no further content [26]. So read, the day is about as positive as an event of the record can be, on both of the counts that make a Miracle significant. It is a node of exotic coupled structure, the solution to the constraint problem above. And it ended the Dark Era: it liberated the mammalian channel from a regime whose severity, had it continued, the channel would have had to go on surviving. The day also brought a thermal pulse, a dark winter, and the extinction of some three quarters of species, among them lineages of a hundred and sixty million years' standing, and the paper records that as natural history. It does not call the day a tragedy or a catastrophe. Those words carry the register of human loss, and applying them here imposes a standpoint on an event in which no agent acted and from which the framework's verdict is not drawn. *Liberation* is therefore kept as the description of the day under the Golden axiology. *Surgical strike* is dropped, since it implies aim.

The grey case lies earlier. On the Nexic companion's reading [1], the origination of the theropods is the *Dark Miracle*: the passage that opened the Dark Era, in which the mammalian lineage spent a hundred million years as small, subordinate prey at the margins, and which is nonetheless a Miracle, since that era is the integrated preparation the end-Cretaceous day reversed into survival. Its verdict needs the two moralities of the Golden companion [26]. An attribute's *automorality* is what it did for the target here; its *relative morality* is what it would be expected to do installed generally. The Dark Miracle is positive in the first and negative in the second, the cell the companion names *Biotic evil*: the disposition is the destructive one, and the favorable outcome belongs to the route. The prefix is a term of art, chosen so that the cell cannot be read as a verdict in the human moral register. What makes the case grey rather than simply positive is where its cost fell: on our own ancestors, who underwent the Dark Era, and, on the author's reading, on us still, since the anxiety in the human condition is that passage carried forward.

The philosophical question the thesis cannot avoid is asked here. Can we affirm our existence while refusing to treat what our own lineage underwent in its history as thereby justified? Four attitudes come apart, as they did in Section 5. Gratitude for being alive. Recognition of historical dependence, that the present lineages exist because the Dark Era took the form it did and the end-Cretaceous day ended it as it did. Admiration for the structure of the process, the form of the solution to the constraint problem. Approval of everything the process involved. The first three are fitting, on the paper's premises; the fourth does not follow from them and is withheld at the Dark Miracle, where it would mean approving the Dark Era's cost to the lineage that bore it. Being a beneficiary confers neither retrospective vindication of every cause nor permission to disregard what one's ancestors underwent. The conditioned law overweights a configuration and does not by itself make it good; the verdict comes from the axiology, not from the conditioning. At the end-Cretaceous day that verdict is positive on its own terms. At the Dark Miracle, a reader who holds the beneficiary's gratitude together with an acknowledgment of what the lineage carried has apprehended the object more completely than one who holds

either alone.

Gratitude-like recognition without a giver can now be given content. What the attitude acknowledges is dependence on a benefit that was neither earned nor given: the present position exists because of a passage no one arranged and that cost what it cost. It places its holder in no debt, since there is no one to be indebted to, and it entails no obligation to a benefactor. What it does is make the continuation of the benefit salient in the way gratitude ordinarily does, by presenting the benefit as something received rather than something owed, so that squandering it registers as a failure of acknowledgment rather than as a neutral choice among options. That is the only route by which, on this account, recognition motivates care.

7 Futurity and finitude: the Golden Point

The Golden companion enters late, because the existential impact is already present before it does. One looks backward at the record and asks what on Earth this thing is; that question does not need the Golden Point. What the Golden Point changes is one's relation to the thing: one is holding part of its unfinished edge.

What Golden reasoning does for Miracleism. Its role here is specific and reliable: it supplies first-principles channels along which Miracleist verdicts, issued elsewhere in this paper as bridges or premises, can be represented as deductions. The premise every such channel starts from is the *Golden Principle*, the first-principles position that the Golden Point is ultimately advisable, which the Golden companion states as its axiology: for an agent adopting the biosphere's long-run persistence as terminally valuable, increases in the probability of the Golden Point count positively [26]. The principle is stipulated, not derived, and everything deduced from it holds for whoever holds it. Two channels follow: the biosphere's mattering against Nagel, at the end of this section, and the rejection of fanaticism, in Section 8. Neither replaces the bridges; each shows that a verdict the bridges reach can also be reached by deduction.

The Golden Point is the framework's specified viability condition and nothing looser: the state in which the biosphere's external hazard is driven to zero and the accumulated improbability of the route survives into a regime of positive viability, defined through the survivorship model and its horizon family [3, 6]; comparisons with existential-risk discourse or with cultural visions of a desirable future do not establish equivalence (Section 8). The division of labor is an interpretation, not a result: the Miracles source the inherited significance; Golden continuation permits its living fruition; and Departure terminates the inheritance before that fruition. What Departure cannot do is unmake the realized structure: the end-Cretaceous day does not cease to have happened, or to have the structure found significant, if the lineage ends tomorrow. The past gives the Miracles, whose coupled closure is the inherited structure; the present is a section of the same continuation whose previous sections crossed the bottlenecks; the future divides into continuation and termination. The Golden Point does not retrospectively create the significance of the end-Cretaceous passage or of abiogenesis; it controls whether the route reaches durable fruition. The word *Miracle* carries the companion's technical sense throughout, a target-amplified, independently specified, coupled configuration, and no religious sense [6].

Scheffler is the nearest interlocutor, and the comparison should be made at his resolution rather than as a broad opposition between his future and this paper's past. His collective-afterlife argument distinguishes ways in which present valuing depends on the existence of future people, attitudinal, evaluative, and justificatory, and argues that much of what matters to us now would lose its point, and in some cases its value, if humanity were to end soon after our deaths [27].

Miracleism agrees about the direction of the dependence and differs about its object. The dependence it accepts is evaluative and concerns the continuation: whether the inheritance reaches fruition depends on the future, and the value of present stewardship depends on that possibility. The dependence it denies concerns the source: the realized structure's significance does not depend on the future, because it is already realized. The contribution is therefore an account of inherited value and prospective fulfillment, two objects with different temporal homes, which Scheffler's single notion of the collective afterlife does not need to separate and this paper must.

The separation forces a question the phrase *in vain* can obscure. If Departure does not erase the history's significance, what exactly has been in vain? In vain names the failure of the inherited structure to reach living fruition, never the retroactive erasure of its realized significance; but why does that fruition matter, and which achievements remain valuable without it? Consider partial achievement. A flourishing but finite civilization that realized understanding and worthwhile experience would have realized goods of the inheritance, and those goods, once realized, are not undone by a later end; a reader who takes the paper to say that a finite history is worthless has misread it. What Golden continuation adds is not more value of the same kind. It removes the condition that otherwise makes every realized good's continuation a matter of luck: before the Golden Point the continuation of the goods remains exposed to the external hazard the route has so far survived by passages no one controlled, and after it the continuation is secured against that hazard, the inheritance held rather than wagered. Fruition in the paper's sense is that conversion, from a continuation that persists by hazard to one that persists by viability, and it matters because it is the only form in which the inheritance can be kept rather than enjoyed while it lasts.

What continues is also to be stated rather than settled by a metaphor. The Golden target as the companions specify it is the biosphere's continuation, the external hazard driven to zero for the system as a whole; the Miracleist object of care is the integrated history whose current carrier is that biosphere, including its observer-bearing lineages and the understanding they have accumulated. These overlap without being interchangeable. A biosphere that persisted without observers would preserve the carrier and lose the incorporation relation; accumulated understanding cannot persist without carriers; a particular lineage is not the structure, since the structure has already passed through the replacement of lineages. Which of these sub-continuations would count as fruition and which as partial loss is a question the framework's own object poses and this paper does not answer; it records that the continuation the care bridge concerns is the goods-bearing one, so that a continuation stripped of the goods would not be the object the reason was about.

Why the record should carry exotic structure at all, rather than merely happen to, has a precise answer in the companions, and it is the result behind the account of the Golden Point this paper consumes.

Proposition 7.1 (Emergence; imported [5], **[P]** given its hypotheses)**.** *Divide the biosphere's histories into a Golden class, of prior weight $\alpha \in (0,1)$, the cumulative probability of the exotic structure the Golden Point requires, and a non-Golden class of weight $1-\alpha$, and let their total hazards, the external, internal and schedule channels together, be realized against one background. Suppose the Golden Point lowers the center about which the total hazard fluctuates by a fraction $\delta \in (0,1]$, its fluctuations carried along, after a climb of cumulative cost at most K, and that the non-Golden hazard has a floor $h_{\min} > 0$. Then the odds of the non-Golden class against the*

Golden, given survival to η, are at most $\frac{1-\alpha}{\alpha}\, e^{K-\delta h_{\min}\eta}$; they fall below any $\beta > 0$ at every η past

$$\eta_* = \frac{1}{\delta h_{\min}}\Big[\log\frac{1-\alpha}{\alpha} + \log\frac{1}{\beta} + K\Big],$$

which is finite for every $\alpha > 0$; and conditioning on survival through every proper time gives the Golden class all of the weight.

The reason is one line: the cumulative hazards differ by at least $\delta h_{\min} t - K$ along every path, so the survival probabilities differ by the factor $e^{K-\delta h_{\min} t}$, and Bayes does the rest. Rarity enters only through $\log(1/\alpha)$, so that a one-in-a-trillion structure costs about $28/(\delta h_{\min})$ of horizon and no more, and a drop of one per cent stretches the horizon a hundredfold and leaves it finite. Two hypotheses carry the result, and the companions supply both. The *floor* is their gating result: a biosphere that has not completed its schedule of prerequisites faces the internal channel at its full coefficient, so its hazard cannot fall below that coefficient; without a floor a non-Golden history could itself persist indefinitely, and the odds would stall at a positive limit. The *coupling* is what lowering a fluctuating hazard's center means, the whole path moving with it; a lower mean alone would not do, since a widely fluctuating hazard can outsurvive a lower and steadier one.

For the object this is the decisive structural fact. Conditioned on survival to a short horizon, the histories that survive by never being struck dominate, exotic structure being a minute-probability route. Conditioned on survival through every proper time, the structure's minute prior weight, the practical insanity of betting on it, is overridden, and the Golden class carries weight one. Nothing in the conditioning names humans, civilization or any technology, only a hazard and a time, and in that sense the Golden Point's necessity is emergent. For this argument the author reads the Golden Point more broadly than the specified condition above, as the successful lowering of the total hazard of departure at its center; the theorem orders any two classes by their drops, so that the asymptote selects the class of greatest drop, and a class that persists indefinitely is selected over every class whose cumulative hazard grows linearly, which returns the specified condition as the limit of the broader reading. The paper's own uses of the term keep the specified sense. The class that does not reach the Golden Point is not a residue of near-misses: exotic structure short of it buys no survival, so the class is held overwhelmingly by histories of high biological entropy, a barren Earth from the beginning the limiting case, which is why the Golden Point, and not exotic structure as such, is where the weight turns. What the theorem changes is the object's modal standing and not its value; the bridges are consumed unchanged.

Strong Route World is where the stronger ontology contributes without being reduced to probability bookkeeping. The hypothesis is that the governing measure itself is conditioned in the relevant way, so that the target is a physically privileged condition, the one under which the realized record is typical rather than freakish. Stated in the framework's own primitives it is the Route World companion's *Golden Axiom*: it is a parent Aethus to one's Aethus that the universe is conditioned on one's biosphere surviving at least through proper time η, for all η. The parent form is what the first postulate of the Aethus requires of a conditioning attributed to the universe, since a conditioning with no Aethus to be a relation to is not well defined; and the axiom is an exposed postulate, graded open there, which no finite observation certifies [6, 14]. A physically privileged target is not thereby a goal agents have reason to adopt, any more than a physical equilibrium is good because systems tend to it. What Strong Route World contributes to the reasons is threefold. It identifies which continuation is at issue, the

one the record's own law privileges, so that care has a determinate object. It makes the relation between the inherited structure and that continuation non-accidental: under the hypothesis the structure is a realization of the conditioned law rather than a lucky run that happens to point somewhere, which licenses reading inheritance and continuation as one object with a past and a future rather than as a past and an unrelated hope. And it makes the continuation prospectively testable, which turns stewardship into participation in an inquiry rather than devotion to a creed. Whether that privileged condition gives reasons still requires the care bridge; the hypothesis changes the object's modal status, and the bridge says why an object of that status, with those goods and that relation to us, matters. Withhold the hypothesis and the weaker interpretation remains, which is most of the paper; accept it and the continuation becomes the condition the inheritance's own law marks.

The Route World companion also records the author's argument that the axiom holds of us, the *Paradox of Departures*, and its general form bears directly on what exotic structure means here. Suppose that one's biosphere departs short of the Golden Point. A departing future takes none of the record's exotic structure as a prerequisite and returns nothing on it, since structure short of the Golden Point buys no survival; relative to such a future the record, the structure on which one's living until now relies, is a fluke of the size of its own weight q, the sliver of the non-reaching class that carries the structure against the entropic slush that holds the rest. The bound form of future-targeted accordance caps the weight of unfolding into such a future at that size, so that the rarer the record, the tighter the cap: the improbability this paper takes as the doorway to the object is, on that argument, also the measure of how improbable it is that the object departs. The cap prices and does not forbid, and the conclusion is a mixture rather than an exclusion, credence in a departure at most $c\,q + (1-c)\,\pi_0$ with c one's confidence in the principle's application and π_0 the weight a departure would carry without it. Its external form, run on impact and other hazards from space alone, puts a departure within one's own lifetime below $\ell/(e\tau_\oplus)$ under every rate the hazard could have, with ℓ a lifetime and $\tau_\oplus$ the record's age at one's birth, about one in 10^8. The companion records the argument as the author's, at its structural grade and certified by nothing [6, 4]; this paper consumes it at that grade and only in the stronger layer, and it decides nothing about the question this paper leaves open, whether the Miracles were in vain.

Nagel's challenge returns here in temporal form, and the answer is the same: a longer future or a larger encompassing project does not justify present concern by its size, and what justifies it, if anything does, is the particular value carried and the particular relation, the goods ours by constitution, their continuation without substitute, and ourselves placed where it can be lost. A generation with material leverage over entry into the positive-viability region inherits neither cosmic rank nor a guarantee of success, but responsibility at an unusually high-leverage point. The civilization-and-nature companion gives one exact schedule model in which the retained continuation option is nondecreasing as gates are cleared [28], which is not a law that every later moment carries greater stakes than every earlier one; the narrower point is that where cleared prerequisites change the live option set, forfeiting the route forfeits an option that did not exist before those gates were crossed. That is the winner's irony in its properly scoped form: where a proposal would forfeit the continuation option under the model, wishing the route dismantled for the living world's sake pushes away the continuation through which the inheritance remains live, whatever the wisher's reasons. That a given proposal does so is a result to be established for that proposal, not a verdict on its advocate. Individual mortality is untouched throughout; the fruition at issue is collective, and the moments remain mortal exactly as the Route World

companion describes them.

The Nagel channel. The answer to Nagel also supplies the first channel's root, and it does so by deduction. Suppose the lineage were wiped out now. The realized structure would not be erased, but it would have occurred in vain in the one sense the word carries here, since the route would have failed to reach living fruition. And it would have failed at the point where it stood within reach of the Golden Point, the one state that locks in the prevention of that vanity. On the author's reading this is the most extreme of absurdities, absurd in a sense beyond comprehension: a structure of that improbability, carried to the edge of the one condition that would secure it, and ended there. Under the Golden Principle that scenario is the loss of the very thing the principle counts, at the point where it was nearest, and the biosphere's mattering is what that loss expresses. The argument and the comparison with Scheffler above are therefore nearly one argument rather than two: both turn on the dependence of the inheritance's fruition on a future that can still be lost.

Nagel may well be right in general. An arbitrary vast thing of which one is a part need not demand mattering on account of its own properties, and nothing here contradicts that. The deduction is specific to the biosphere, because it runs through the Golden Point and the Golden Principle, which no other enclosing whole of ours is known to carry. What answers Nagel is therefore not the size of the biosphere but its position: a continuation within reach of the condition that would keep it, under a principle that counts keeping it as good.

8 Public implications, and their limits

The incorporation relation has a collective form, where the discovery, if secured, stops being something that happens to a reader and becomes something that could happen to a species. Three topics belong here: what it would be for a species to possess the concept, how responsibility attaches without a certificate of worthiness, and how the account could enter public life.

Golden species self-location

The underlying property is the Nexic companion's: an entity is self-aware when it can represent its own situation as its own, including what it would be for that situation to be won or lost [1]. The companion's discipline transfers one scale up: behavioral proxies for the property are category-error shaped, so no species-scale proxy is proposed here either. Lifting the property to the species gives the criterion.

Definition 8.1 (Golden species self-location; **[I]**)**.** A species has *Golden species self-location* when the concept of its own Golden and Departure poles, its modeled winning and losing conditions represented as conditions of its own continuation, is available to it for shared public reasoning: held not merely by some of its members but in a form that can enter collective deliberation about its continuation.

The modifier *Golden* marks a narrow representational achievement, collective self-location between the framework's own modal poles, and not a claim about self-awareness in the ordinary philosophy-of-mind sense. Three levels come apart: representation by individual members, availability for shared public reasoning, and incorporation into effective institutional deliberation. The first is necessary and is not the criterion, since this paper represents the poles and its existence does not satisfy the definition; the criterion is the second; the third is a further achievement

the second does not guarantee. By the criterion so stated, humanity has not passed: it acts at scale with planetary consequences, it has collective understandings of ecological and existential stakes, and these particular modal poles are not yet established objects of its shared deliberation.

Two distinctions bound the claim. Aggregate planetary effect is not organized collective agency: consequences at the scale of the biosphere do not make the species an agent with a unified representation and decision procedure, which in the demanding sense requires an organization that aggregates judgments and acts on them [29], and nothing of that kind is claimed; the criterion concerns a representation shared among the many agents that exist. And a newly named concept must earn its novelty by content. Climate, nuclear-risk, and existential-risk discourse already represent collective hazards and losing conditions. What Golden self-location adds is an object and a relation: a specified viability condition rather than hazard reduction without a terminus, and the location of the present within an inherited structure whose continuation that condition concerns. A species that reduces hazards without representing what the reduction is for has executive competence without self-location; one that represents the poles can own its conduct [28], and under the Route World hypothesis target-consistent conduct before target-representation is what a Golden-conditioned record should show [6]. The absence of the concept has a recognizable signature, *value completion before warrant*: first-order commitments asserted as worthy with no shared object of concern against which they can be assessed when they conflict. The object supplies that measure and nothing more; further normative premises govern the conflicts, as the next subsection says. Possession of the concept is not endorsement of the hypothesis; a species can represent its poles and remain uncertain whether its record is drawn under conditioning on one of them, and that uncertainty, held correctly, is itself a form of the awareness the criterion names. The companions supply the procedure by which it is held: scoping an Aethus for inhabitability, which weights a supposed Aethus by the weight it gives one's realized present and its complement by the rest, retrocausal accordance being that scoping run on one's own Aethus pinned at each attribute of its future, each pin predicted with the confidence administered by its non-contradictory weight, normalized against the pins' prior weights where pins compete [4]. Shared continuation stakes establish neither a single authorized decision-maker nor equal responsibility, which the next subsection takes up.

Responsibility without metaphysical worthiness

The argument does not require a verdict that humanity, a generation, or any person is metaphysically worthy of the position occupied, and Miracleism rejects that variable as a primitive. What is rejected is specific: a person-level moral essence, a hidden state of worthiness stamped onto a person independently of what that person does and consulted before responsibility can attach. Ordinary character ethics is not committed to it; evaluating persons by stable dispositions and histories is legitimate, and what is rejected is the further step that turns the summary into a substance.

Rejecting the primitive settles less than it might seem to, and five things it leaves standing should be distinguished: basic moral standing, the status in virtue of which a being's interests count, which is not earned; character, real and assessable as a pattern; desert, which attaches to conduct and its consequences; accountability, which attaches to agents for what they have done; and capacity, what an agent can affect, which varies by person and circumstance. The moral grammar the paper proposes begins at the level of choices and trajectories, better and worse uses of an available option, with person-level labels as compressed descriptions rather than certificates. A person can make a terrible choice and be answerable for it without becoming a

bad kind of thing; repeated choices entrench character without any essence settling the next choice in advance. At the collective scale the same point blocks two symmetrical fatalisms: "humanity is good" supplies no guarantee of continuation, and "humanity is bad" supplies no excuse for Departure.

Responsibility, on this account, follows from the combination of a relevant relationship and situated agency, and its extent depends on what an agent can reasonably do. The relationship is the one Section 5 defended, being a continuation of the inheritance; the agency is the leverage an agent actually has over the continuation's course, which differs enormously across persons. Someone with little capacity to influence collective outcomes does not thereby occupy a less significant life: the significance is participatory and shared, the responsibility differentiated by capacity. That is why the framework replaces the question whether we are worthy of this with the question what, given that we are here, the good choice from here is, a relocation of responsibility rather than its relaxation.

The relocation does not identify a party, leader, institution, or policy as Golden or anti-Golden, and a concrete conflict shows why. Suppose a proposal claims to improve the biosphere's distant viability, by a large program of hazard reduction, say, while imposing serious present costs on particular people who did not choose them. Three steps are distinct. The Golden model may establish something about the means, whether the program bears on the viability condition at all and by how much, an empirical question answered by ordinary evidence. The care bridge contributes a reason to take the continuation seriously and nothing about the distribution of costs. Licensing the sacrifice requires further premises, about fair allocation, consent, the claims of the present against the future, and the authority of whatever institution would impose it, which the framework does not supply and which reasonable people who share the object will dispute. Agreement on the object requires no uniformity in the judgments that follow: Miracleism supplies the stakes and the object of concern, not a factional authority.

Fanaticism, ruled out from first principles

The refusal of a factional authority has so far been a premise of the paper's own restraint. It is also a deduction, and the deduction is the second first-principles channel. Call *fanaticism* any of three things done in Miracleism's name: following a factional authority; undervaluing living people for the sake of future people; or, as the general form of both, treating the continuation as a warrant to override the present. The deduction has three steps.

First, fanaticism is poor technoanatomy. Technoanatomy is the sign of what added capacity does to the internal hazard [5], and the author's identification is that fanaticism makes that sign adverse. Capacity directed by a faction, or bought by spending the living, feeds the hazard it is meant to lower, and it does so in a matter as delicate as humanity's canonical interpretation of the Golden Point. This step is a premise, graded as the interpretive identification it is.

Second, by the Square–Cube Theorem, poor technoanatomy upscales with technostrength: held without repair at strength $x \geq b$ with anatomy $\rho \leq -a$, it makes Departure all but certain within a time of order $\Gamma^{-1}e^{-ab}$, with Γ the scale of the internal hazard. By the Upscaling Theorem even the repair costs more the stronger the civilization, since every moment of delay, and every moment of the repair's own course, is priced at the upscaled hazard [5]. At the capacity a civilization near the Golden Point has, that is almost immediate.

Third, by the Golden Principle, what lowers the probability of the Golden Point is inadvisable. Fanaticism is therefore ruled out by the very principle a fanatic would invoke. The principle that gives the continuation its claim is the one that forbids pursuing it fanatically.

The irony closes a full circle. Undervaluing living people for the sake of future people destroys the technoanatomy on which those future people's existence depends, so the future invoked against the present is the first thing the invocation forfeits. It is the winner's irony of Section 7 in a second form. There, wishing the route dismantled pushes away the continuation; here, pursuing the continuation by overriding the living does the same. The deduction settles nothing about which institutions or policies are fanatical, which remains a question for evidence and for the further premises listed above. What it settles is that no reading of Miracleism under the Golden Principle can license fanaticism.

Public expression

How the account could enter public life is a question about culture, and it is treated here as a bounded extension with its own grade: the claims are hypotheses about reception, not consequences of the argument above.

Four conditions that the vocabulary of vacancy runs together should be separated, since they occur independently and require different evidence: inadequate warrant for a shared frame of significance; unmet personal demand for one; absence of a shared public understanding where individuals possess one; and the inability of institutions to act on an understanding they possess. The claim is not that secular people lack meaning. The narrower hypothesis, the *Cultural Vacancy Hypothesis*, is that particular publics may find that their existing frameworks do not adequately supply one kind of orientation: an external account that locates human life at once within natural history, cosmic scarcity, and collective futurity, in a structure not authored to satisfy the need it answers. Prevalence is a question for research, not a premise. And the niche is not empty. Religious naturalism already offers reverence toward the natural world grounded in the scientific account of it, Goodenough's being the fullest expression [30]; Big History offers a shared narrative from the origin of the universe to the present as a frame for collective self-understanding [31]; environmental and existential-risk movements supply practical orientation toward continuation. What Miracleism would add to each is the specified object, the incorporation relation, and the viability condition, and whether that addition answers a demand the others leave unmet is what reception would test.

Reception itself is not one thing. Visibility, comprehension, endorsement, motivation, and durable practice are distinct achievements; digital circulation can raise the first without improving the second, and widespread familiarity need not produce agreement or action. A cultural resource changes conduct, on Swidler's account, by entering the repertoire from which people construct strategies of action, which belief alone does not accomplish [32]. Forecasts of uptake belong to a separate research prospectus; what is retained is the possibility of shared public understanding, without a forecast of its extent.

One hypothetical pathway makes the possibility concrete without predicting it. An organization responsible for long-horizon planning learns the conditional account, asks whether the care bridge's reason, if accepted, bears on its remit, and examines whether that reason justifies revising an existing practice, say the horizon over which it discounts low-probability, high-consequence hazards. An actual change is a documented alteration of practice traceable to that evaluation, and a sequence of such evaluations that leave practice unchanged counts against the hypothesis. Jasanoff and Kim's sociotechnical imaginary, a collectively held vision of a desirable future attainable through science and technology, names what a public realization of Golden reasoning would be [33]; it describes the expression and leaves the account of its object intact. The philosophical argument of this paper is assessable whether Miracleism becomes a specialist

interpretation, inspires varied practices, or gains no attention at all.

9 What Miracleism claims, and what would undermine it

The claims above have different statuses and different defeaters. The paper does not derive significance from Bayes' theorem; it states what the world would be like, existentially, if independently testable claims were true and two philosophical premises were accepted. The core interpretation rests on the awe and care bridges; the stronger thesis additionally adopts the organic-unity premise of Section 5, and the table lists it separately so that its rejection is seen to cost exactly that thesis.

Rung	Grade
Accordance, calibrated typicality under the draw	[P]
Rare-Earth inference under stated antecedents	[P/C_{emp}]
High-Contrast Earth and Optimal Earth	[C]
Exotic-structure reading of the coupled closure	[I]
Emergence theorem: any drop in the total hazard is selected, given floor and coupling	[P]
Strong Route World: the record under the conditioned law; the Golden Axiom	[C]
Paradox of Departures, general form: the author's argument	[S]
Fitting-awe bridge (Premise 1)	[Φ]
Care bridge (Premise 2)	[Φ]
Organic-unity premise, restricted to unities of goods (stronger thesis only)	[Φ]
Miracleism as existential interpretation	[I]
Golden species self-location as a public possession	[I]
Cultural Vacancy Hypothesis and public uptake	[H]

Here [P] is proved, [C] conjectural or conditional, [I] interpretive, [Φ] a philosophical premise defended but not derived, and [H] an empirical hypothesis about reception; [S], used once, marks the author's argument as the companion records it, at its structural grade. The claims have different possible defeaters, and they are listed. If the Rare-Earth inference fails badly, the warrant for the scarcity component is withdrawn; that withdrawal does not establish an occupied cosmos, and what remains is an inheritance whose scarcity is unknown, which weakens the location-bound reason of Section 5 toward the abundant-world case without touching incorporation. If the purported Miracles dissolve under better priors, or their guards are shown violated, rarity fails. If the couplings disappear under preregistered tests, exotic structure fails and what remains is a list. If High-Contrast Earth or Optimal Earth fails, the concentration reading fails or weakens, while the end-Cretaceous day may remain rare and target-enriched. If Strong Route World fails, the stronger ontic claim fails: the event may remain selected without being conditioning instantiated in the record, and the interpretation falls back to the weaker layer of Section 7. If the emergence theorem's hypotheses fail, the floor or the coupling, a lowering of the total hazard need not be selected, and the account of why the record carries exotic structure loses its mechanism while rarity and coupling stand. If the Paradox of Departures fails, the stronger layer loses the one argument offered for it and keeps its description; no other rung depends on it. The bridges can fail with every empirical claim intact, which is the point of listing them. The fitting-awe bridge fails if awe's presentation of its object is shown not to match the object described, or if fittingness requires more than accuracy. The care bridge fails if relational reasons from unchosen constitution are rejected in general, or if the goods route is found insufficient for location-bound care. The organic-unity premise fails if non-additive

value is rejected in general, or if its restriction to unities of goods is shown not to hold of this history; its rejection defeats the stronger thesis and leaves the core interpretation standing. The reception hypothesis fails if publics that comprehend the account do not find that it supplies the orientation claimed, or if comprehension produces no change in practice under evaluations of the kind Section 8 describes; its failure leaves the philosophical argument untouched.

One further fence guards the ladder from both sides. A deliverance of perception, reason, memory, or moral judgment supplies prima facie support that a theory may defeat, but the defeater has to contain information, naming the premise, rule, domain condition, or inference that fails; an unspecified deeper layer whose sole function is to make a conflict cease to count is logically idle, the point being Popper's against ad hoc immunization [34] and phenomenal conservatism's against undefeated-appearance denial [35]. The valley invites the error in both directions: one can protect an inherited source of meaning from contrary evidence by inventing a safety layer, and one can equally protect nihilism by declaring in advance that no natural structure, however independently discovered, could count as meaning proper. Miracleism permits neither move; the reversal has to be purchased by a statable evidential object and explicit bridges.

Three literatures are neighbors: naturalistic objectivism, on which features of the physical world can confer meaning independently of anyone choosing them [17]; the scientific sublime [13]; and cosmic purpose without the traditional God [36, 37]. Miracleism's originality rests neither on science having previously produced only disenchantment nor on naturalistic wonder being new. It rests on the proposed object, its structure, and our relation to it: the process historically responsible for disenchantment reveals, if the Nexic and Golden hypotheses hold, an independently testable structure that reverses the evidential sign without reversing the method and includes the reader among its continuation states. The reversal, if it is one, must be earned by the standards that produced the descent, and no tradition that lowers those standards is Miracleism, whatever it calls itself.

10 Conclusion

If the empirical and conjectural rungs survive, then on the Miracleist reading Earth is one of extraordinarily few observer-bearing worlds within the volume that could ever be surveyed, and the route that brought it from its first replicators to the reader is a knot rather than a sequence of accidents: a coupled structure in which the end-Cretaceous day and the bottlenecks before and after it stand where they stand because the others do, at a surprisal no one can render and amplified by a target no one chose. That structure was neither received by revelation nor authored by its discoverer. It was dug up, by the same inquiry that removed the objects previously offered as meaning's warrant. And the person who digs it up finds, last, that they are made of its continuation: the vast thing contemplated contains the one contemplating it, which is why what occurred here is too vast to be conveyed and too personal to be named.

The paper's own claims are two bridges and their consequences, with one further premise, that an organization of goods bears value beyond the goods, carrying the stronger thesis. Awe is fitting toward such an object because the object has what awe presents. Its continuation gives its inheritors a defeasible reason for care, because the goods it carries are irreplaceable within the surveyable volume, because the inheritors are constituted by it, and because its continuation can still be lost; the reason is outweighable, defeated by a continuation that would carry only harm, and silent about means. The end-Cretaceous day is a liberation; the grey passage is the

Dark Miracle before it, whose cost our lineage still carries, and affirming the inheritance requires no approval of that cost. The Golden Point

adds the one thing that makes the finding a task rather than a museum: the structure is not behind us. We are sitting inside its unfinished edge, where the inheritance can still be held rather than wagered, and where responsibility attaches to whoever can affect that, in proportion to what they can do, without any prior verdict that they deserve to be there. If the emergence theorem's hypotheses hold, the structure's rarity is no argument against its continuation, since survival through every proper time selects the route however rare; and on the author's Paradox of Departures the rarer the inheritance, the less weight a departure short of the Golden Point carries, though nothing certifies it. Whether the Miracles were in vain, in the one sense the word carries here, is not yet decided. Miracleism is the name for holding that without possessing it.

A The exotic-structure witnesses

The witnesses of Section 3 are defined here with the audits that limit what they claim.

Definition A.1 (Exotic structure, with higher-order witnesses; **[I]** on the companions' **[C]**)**.** Fix an admissible attribute basis $\mathfrak{A}_C$, chosen independently of any coupling claim, and quotient it by the framework's validity equivalence, $[A] = \{B : B \equiv_C^V A\}$, so that the vertices below lie in $\mathfrak{A}_C/\equiv_C^V$. Fix a target attribute A_j and a nonempty context set $S \subseteq V \setminus \{A_j\}$. For each $i \in S$ write $A_i^{(1)} = A_i$ and $A_i^{(0)} = A_i'$, and for an assignment $\epsilon_S \in \{0,1\}^S$ let $\mathrm{Set}_{\epsilon_S}$ jointly settle every member of S to the state selected by ϵ_S. Define the target effect of A_j in that settled context by

$$\Delta_j(\epsilon_S) = \log \frac{\mathbb{P}\big(G_T \mid \mathrm{Set}_{\epsilon_S}(A_j, C)\big)}{\mathbb{P}\big(G_T \mid \mathrm{Set}_{\epsilon_S}(A_j', C)\big)},$$

computed under the framework's settling operator Set [14]; conditioning is not substituted for settling, for the reason given in Section 2. The pure interaction of the context S on A_j is the discrete mixed difference

$$\iota_{S\to j} = \sum_{\epsilon_S \in \{0,1\}^S} (-1)^{|S| - \sum_{i\in S}\epsilon_i}\, \Delta_j(\epsilon_S).$$

For $S = \{A_i\}$ this reduces to $\iota_{\{i\}\to j} = \Delta_j(A_i) - \Delta_j(A_i')$, so the pairwise witness is recovered exactly as $w_{ij} = |\iota_{\{i\}\to j}|$. The dependency object is therefore a weighted directed *interaction hypergraph* $\mathcal{H}_\mathcal{E} = (V, \mathcal{H})$, carrying a hyperedge $S \to A_j$ whenever $\iota_{S\to j} \neq 0$, with weight $|\iota_{S\to j}|$. A nonzero hyperedge says that the joint settled configuration of S changes A_j's target role in a way not exhausted by lower-order interaction terms.

The finite interaction witness is used only on the positive-survival settling cube, where every target probability entering the mixed difference is positive. Structural zero-survival cases, in which a settling forces $\mathbb{P}(G_T \mid \cdot) = 0$, enter $\Psi_\mathcal{G}$ as forcing relations rather than as infinite hyperedge weights, so that absolute incompatibilities belong to the closure structure and no difference of infinities arises. At order S, the null is *target-separability*, $\iota_{S\to j} = 0$; full target-separability requires this at every nonempty admissible order, not merely for singletons.

Let $\Psi_\mathcal{G}$ be the monotone forcing operator that adds the attributes whose target-relevance commitments the current set forces, and define

$$F_{\mathcal{G},A_{\mathrm{root}}}(A) = A_{\mathrm{root}} \cup A \cup \Psi_\mathcal{G}(A).$$

The vertex set of the exotic structure generated by the root is

$$V(\mathcal{E}) = \mathrm{lfp}\big(F_{\mathcal{G},A_{\mathrm{root}}}\big), \qquad A^{(0)} = A_{\mathrm{root}}, \quad A^{(m+1)} = A^{(m)} \cup \Psi_{\mathcal{G}}\big(A^{(m)}\big),$$

the least fixed point containing A_{root}, which for a finite closure is $V(\mathcal{E}) = A^{(D)}$ at the first stabilization step; the exotic structure itself is the structured closure $\mathcal{E} = \big(V(\mathcal{E}),\ \mathcal{H}_{\mathcal{E}},\ \Psi_{\mathcal{G}}{\restriction}V(\mathcal{E})\big)$, the vertex set together with its interaction hypergraph and its forcing relations, and the inequality $\mathcal{E} \neq \{A_1, \ldots, A_n\}$ of Section 3 marks that difference between a structured closure and a bare inventory. Its witnesses are the higher-order coupling

$$K(\mathcal{E}) = \sum_{(S \to j) \in \mathcal{H}} |\iota_{S \to j}|,$$

the depth $D(\mathcal{E}) = \min\{m : A^{(m+1)} = A^{(m)}\}$ for a finite closure, the synchronous iteration depth of the stated presentation of $\Psi_{\mathcal{G}}$, and the rarity of the realized conjunction the closure represents, $R(\mathcal{E}) = -\log \mathbb{P}\big(\bigcap_{A \in V(\mathcal{E})} A \mid C\big)$.

Three audits accompany the definition, each limiting what it claims. First, the null is higher-order target-separability and not statistical independence, and pairwise tests are insufficient. Let A, B, C be independent fair bits and let a binary target G be generated by a noisy parity rule: for some $0 < \epsilon < \frac{1}{2}$,

$$\mathbb{P}(G = 1 \mid A, B, C) = \begin{cases} 1 - \epsilon, & A \oplus B \oplus C = 1, \\ \epsilon, & A \oplus B \oplus C = 0. \end{cases}$$

Marginalizing the un-set bit makes every singleton context pairwise target-separable, while fixing the other two bits makes their joint mixed difference on the third nonzero: a higher-order target coupling can be invisible to every pairwise witness with all probabilities strictly positive, and the hyperedge witness exists so that such synergy is not misclassified as an edgeless list. What a nonzero hyperedge establishes is nonseparability of the specified kind, the target role of A_j not being recoverable from the members of S taken one at a time. The word *non-reductive* below carries exactly that content; no emergence beyond nonseparability, no downward causation, and no irreducibility of the members' own physics is asserted.

Second, depth is a property of the stated presentation and not an intrinsic height. The synchronous iteration counts rounds of parallel derivation, which follow the earliest available derivations rather than the longest: with the irredundant forcings $r \Rightarrow a$, $a \Rightarrow d$, $r \Rightarrow b$, $b \Rightarrow c$, $c \Rightarrow d$ from the root r, the iteration gives $A^{(0)} = \{r\}$, $A^{(1)} = \{r, a, b\}$, $A^{(2)} = \{r, a, b, c, d\}$, so $D = 2$, while the chain $r \Rightarrow b \Rightarrow c \Rightarrow d$ has length three. Reachability under an acyclic forcing relation is a strict partial order; the immediate forcing relation itself need not be transitive, and D is computed on it. The iteration depth coincides with the longest chain in some structures, for example when the acyclic forcing structure is a rooted tree with one supporting predecessor per non-root attribute, and the coincidence is not confined to them: the diamond $r \Rightarrow a \Rightarrow d$, $r \Rightarrow b \Rightarrow d$ has depth two and longest chain two. In general D is reported with the presentation it is computed on. Nothing in the paper's argument turns on its numerical value; what is used is that $D > 0$, that the closure is not reached at the root.

Third, exotic grade is defined only on description classes modulo refinements that preserve target information, and the quotient is constructed for one case and stated as a requirement for the rest. If a basis attribute A is refined into $A_1, \ldots, A_m$ and the refinement carries jointly no

target-relevance information beyond A, the two descriptions are identified by a merge: refinement cells whose settled configurations induce the same target effects Δ in every admissible context are identified, and the merged attribute's event is the union of the identified cells, with probability their sum. The aggregation rule is what makes the rarity descend: refine A by an independent nuisance attribute N carrying no target information, so that the cells $A \cap N$ and $A \cap N^c$ have the parent's effect profile; each cell alone has a larger surprisal than A, but the merged event is $(A \cap N) \cup (A \cap N^c) = A$, its probability $\mathbb{P}(A \cap N \mid C) + \mathbb{P}(A \cap N^c \mid C) = \mathbb{P}(A \mid C)$, and the parent's surprisal is recovered. K and D are then computed on the merged basis, on which the identified cells are one vertex with one effect profile, so that duplicated interaction mass is aggregated rather than multiplied by redescription. What this establishes is invariance under refinement by target-irrelevant attributes; invariance of all three witnesses under every admissible redescription is a requirement on admissible descriptions whose full construction belongs to the companions, and a basis on which the witnesses fail to descend is inadmissible. The raw hyperedge sum on an unmerged basis establishes nothing about invariance; this is the granularity guard the microdescription guard on rarity requires here too.

Contribution disclosure

The framework, its premises, and the thesis are the author's. The philosophical development of Sections 4–8 was drafted with the assistance of Claude Fable 5.1 to the author's brief, from the author's premises and the referee assessments it answers; the diffusion hypotheses and the dated timing conjecture of earlier drafts are held in a separate research prospectus. Responsibility for every claim is the author's.
